with

Experimental Pervors can be generally classified as being of three type 1- personel ever 2- systematic error Van dom error 1-personed error Dias or carelessness in reading an instrument in recording observati stin mathematical calculation Examples 1-Inperforming a series of measurement an observer may become piased faver intavor of the first observation 2- Errors in reading a scale even vertical scale or horizoital scale and parallax

Waterma

cs CamScanner^{**}

2- systematic error Ø are errors associated with particulat medsurment instrument or techniques such as an improperly caliborcilednestrument or bias on the part of the observer Example ? script, S. j 1- An improperty "Zeroed" a palane or ammeter 2- A theramometer that reads 10°1c when immpersal in boiling water and it should be 100°C 3- personal bias of an observer who tor ex always takes a low reading of a scale division This a personal error may be systematic error

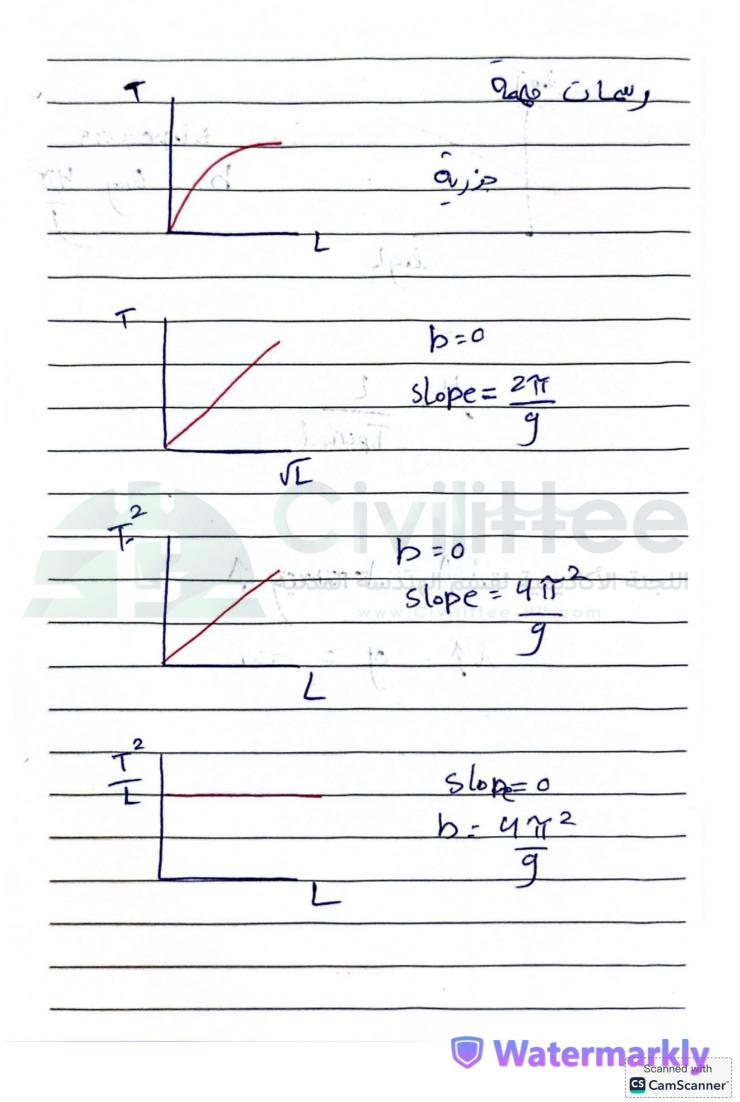

4. A motor stick that has shrunke due to environmental conditions would always real higher 3-Random error accidental errors and control of the observer Example : 1- Upprælitable Fluctuations in temp or in line Voltage 2- Mechanical Vibrations // setup 3-Un biased estimates // of measurment readings by the observer 🛡 Watermar
